1.   INTRODUCTION

Today many things can be made easier by technology, with mobile technology we can send messages quickly and accurately. However, there are many positive and negative impacts of using mobile phones. The role of parents is needed to guide children to be directed in a positive direction. Many children and adolescents are miscommunicated through this technology due to lack of insight. Advances in technology at this time provide major changes in the world. This can be seen from various sides, including changes in the fields of health, education, entertainment, communication, and easy access to information (Prawira, 2018; Poluakan et al., 2019; Sidiq & Achmad, 2020).

As social beings, we cannot avoid the act of communication, conveying and receiving messages from and to others, the act of communication continuously occurs during the process of life. Communication is important because it is a function that can be felt by the perpetrators of the communication. Through the process of communication, a person conveys what is in his mind, thoughts and feelings of conscience to others, either directly or indirectly. Through communication a person can make himself not feel alienated or isolated from the surrounding environment. Hertmada, Sinta Kendek (2017).

Many people depend on their future for teenagers. Adolescents are a small part of the population, but have a very large contribution. It is important to understand youth because youth are the future of every society. Adolescence is a developmental phase between childhood and adulthood. Lasts between the ages of 12-24 years. Muflih (2017). In this era of rapidly growing technology, many things have begun to shift and form a new lifestyle, where technology has become one of the basic needs in human daily life. Technology has changed the way people live in various fields of life. Starting from the learning process, communication between humans, business, entertainment, and others Prasetya, Bernadus Wisnu (2017).

Advances in technology today can not be separated from people's lives. Various information that occurs in various parts of the world can now be immediately known thanks to technological advances (gobalization). In the current era of globalization where technological changes and the flow of information are increasingly advanced and fast, it encourages people to better understand technological sophistication. Al-Ijtimaiyyah (2018) there is a lot of speculation about technology, one

of which is HP (Mobile) (Nulhaqim & Sulastri, 2019; Dadi, 2019; Maulida, 2020). From the journals we quoted, Mobile is a sophisticated item created with various applications that can present various media such as news, social networks, hobbies, even entertainment, this is one sign of progress from technology. The increasing use of gadgets or tools that can be easily connected to the internet,

*WL*can also change family life, work environment, school, friendship, religious activities, politics, and so on are all affected by communication technology. Human-human interaction has been replaced by human interaction and technology is often not realized that can reduce one's direct interaction with the closest people around (for example, between parents and children at home, each busy with their gadgets). Greeting each other by smiling at neighbors is decreasing, while being busy alone in front of computers and other technological tools is considered normal in today's society. Al-Ijtimaiyyah (2018) this is also a negative impact of using cellphones Before the existence of cellphones, gadgets and other electronic devices, people easily greet each other and interact when meeting or at gatherings. At this time people are more cool and busy with their gadgets. People today tend to forget that there are real friends beside them. Prasetyo, Rahmad Adi (2017) and Nurwati & Nandang (2020). With this problem, we from group 3 want to find solutions and new things in today's life. There are many interesting things about how to survive in the electronic age where everything can be done easily.

2.   METHOD

This research method uses qualitative methods. Qualitative research is a method that involves an interpretative approach that requires the subject matter, and also this research works naturally which understands and also provides interpretations that exist in society. Research is an investigation of a field of science that is carried out to obtain facts or principles patiently, carefully, and systematically Umar Sidiq (2019). The sampling technique is done randomly, data collection uses research instruments, questionnaires are a method of collecting large amounts of information that are relatively cheap, fast and efficient, with questionnaires we can also get data from a large sample of people. Data collection is also relatively fast because researchers do not need to be present at the time of filling out the questionnaire. This is useful for researching large populations, where interviewing is not a practical option. This research was conducted from June 8, 2021 to June 30, 2021, which began with giving questionnaires and continued with in-depth interviews, as well as documentation as evidence that the author had conducted research on the Nusantara Islamic University campus and in Sukamanah village. The informants we used as a source of information were 25 teenagers and 15 of them were Uninus students as well as documentation as evidence that the author has conducted research on the Nusantara Islamic University campus and in Sukamanah village. The informants we used as sources of information were 25 teenagers and 15 of them were Uninus students and documentation as evidence that the author has conducted research on the Nusantara Islamic University campus and in Sukamanah village. The informants we used as a source of information were 25 teenagers and 15 of them were Uninus students

3.   Results and Discussion

*Cellphone*e is a two-way electronic telecommunication tool that can be carried anywhere and has the ability to send messages in the form of voice, picture messages, video and others. This definition is a general understanding of mobile phones. The presence of mobile phones has changed the communication system of the community which used to be mostly done face-to-face, but now the community communication system is starting to move from the old communication system (face-to-face) to a new communication system, namely through mobile phones. The development of mobile phones in society is increasing day by day, starting from the facilities provided to large to small ones. There are many new facilities that exist in mobile phones, not only sending messages or calling, but also being used as internet browsing, watching photos, videos and much more. The existence of mobile phones is currently considered as an indispensable necessity for everyone, so everyone must have a

mobile phone communication tool as a tool to support information needs and make it easier for people to carry out their daily activities. Communication is needed to establish an interaction in society.

In our group research on the role of cellphones for the community, especially young people and some people from class A. We get input or things that tend to be contradictory between the speakers, but many also agree. In this case we ask questions such as whether the cellphone is important? Of the 25 people we used as resource persons or respondents, 96% agreed that mobile phones for today are very important. And 4% do not agree with the importance of mobile phones for today. However, they also agreed that the use of cellphones should be limited, considering the effects that would be caused if they continued to stare at the cellphone screen, as many as 88% agreed that cellphone use should be limited and 12% disagreed that cellphones should be limited.

It has been proven that cellphones are very important for today's life, the question we ask is that whether every activity of the respondent requires a cellphone, their answer is 52% agree that cellphones can make their activities easier while 40% of them also stated that every activity does not require a cellphone and the rest answered no. always because the activity is not only from the cellphone. however, 88% of respondents agreed that cellphones can cause quite dangerous side effects and some people also added that when using cellphones for too long will cause headaches and eye pain (Dadi, 2014; Sidiq, 2019).

In this day and age technology is very easy to access, all people can use technology very easily. However, there is some controversy regarding the addiction of minors to cellphones. And here are some opinions about minors who are addicted to cellphone technology:

Pro	Counter
As long as it is used for positive things, there is no problem.	Very risky for children's growth.
If it is used to make learning media, it's actually worth it, and the role of parents is very important in limiting children's internet access.	Children should not be given access to mobile phones because there is no urgency needed.
It's okay as long as it's not affected by the bad things out there.	You should not be given internet access first, because many minors need to socialize with their peers.
We have to adapt to today's technology.	It's pathetic, what's more, just to be used to play games.
	It's hard to get in a better direction, because it's been affected by technology.

The conclusion from the above statement: that many young people and some people from class A do not agree that underage children are addicted to playing cellphones and the role of parents must be very carefully considered (Sudrajat et al., 2019). This is also supported by Kwon, et al explaining that mobile phone addiction is an addictive behavior or attachment to cellphones that allows social problems such as withdrawal and difficulties in daily activities.

The role of parents in guiding children still needs more attention, from 23 respondents' answers, many agreed that many parents still let their children play cellphones without

direction from their parents, as a result, many children aged 7-15 do not understand the meaning of good and proper use of cellphones. true, many young people who fall into negative things. For example, in the case of freestyle in the FREE FIRE game, many young people practice it in their daily lives. And this seems to be common nowadays.

The negative and positive impacts of using mobile phones according to respondents:

Positive	negative
Make activities easier.	Can lead to a sense of dependence.
Can send messages over long distances and quickly.	Can forget about things that happen to the surrounding environment.
We can learn new things that we don't know.	Radiation that causes health problems.
Become a medium of entertainment.	Turns someone into an introvert
Can find things about Health, the latest news and others.	Violence, hoaxes, pornography.
Unlimited communication.	Academic achievement has decreased.

Until now, the use of cellphones has become a matter of debate. The conclusion from our group is that the use of mobile phones will be beneficial for those who use it and vice versa. In this case, technology is something that can make us a good person or a bad person, depending on how we use it.

Suggestions and input on the use of mobile phones today:

1. Do it in a positive way and limit use.
2. Increase activities without using a cellphone
3. Use your cell phone sparingly.
4. Smarter in communication.
5. More towards the positive and leave the negative things.

4. CONCLUSION

The use of mobile phones is very influential on the social interaction of adolescents, both positive and negative influences. Positive influences include facilitating communication even though they are far away, making it easier to find information and so on. While the negative effects generated by the use of cellphones include the dangers resulting from using cellphones too often, teenagers are more likely to prefer communicating through the media rather than communicating face-to-face directly. Furthermore, cellphones can make teenagers experience dysfunction, the time for direct face-to-face interaction is reduced, the presence of cellphones interferes with the quality of direct interactions, cellphones make teenagers hyperpersonal, cellphones make teenagers consumptive and cellphones make teenagers less

sensitive to the surrounding environment. Factors inhibiting adolescent social interaction patterns are environmental factors of family, community, religion, customs and habits. These factors can make social changes in adolescents in particular and society in general.
