ABSTRACT (10 PT)

The online learning in English language has been going along with the rapid development and diffusion of the information and communication techologies and shifted from being merely marginal trend to become popular, where the number of higher education institutions has dramatically increased to offer and led to extremely changes many aspect in learning societies. This study explores the technical abilities, technology accessibility and self directed learning that contribute to student attitudes towards online English learning in predicting the continuance intention of the online learning. 10 tertiary students were interviewed as preliminary study, then 36 students were surveyed through questionnaire in a pilot test. The validated questionaire were used in this study on the 102 students. Rasch measurement model was utilized to validated the 25 items of questionnaire, meanwhile the Smart PLS ver. 2.0 was used to assess the regression of exogen to endogen variables. The study concluded that self directed learning contributed to the attitude towards online English language learning as mediator to continuance intention of online learning.

1. INTRODUCTION (10 PT)

With the help of digital technology, online learning has shifted from being merely marginal trend to become popular in English language learning. A plethora of researches has been conducted on the digital technology-based learning applications in courses used to count on face-to-face meetings, such as foreign language learning [1]-[4]. Scholars in Indonesia believe that the policy of the Indonesian Ministry of Education of Culture (MOEC) to continue implementing online learning permanently, even after the Covid-19 pandemic subsides, is the strategy of converting traditional learning into hybrid learning, which is also a paramount change to Indonesian upcoming education strategy [5]. Eventhough the issue of internet access may have been slightly resolved by the MOEC's policy by providing free internet quota to students, yet the issue on the online language learning are not merely resolved. Students are expected to adapt to the changes caused by Covid-19 through technical abilities, technology competencies [6]-[8] self-directed learning, and attitude toward e-learning [5], [7], [9]-[14].

Blended learning, hybrid learning, e-learning, distance learning, and online learning are the common terms dealing with digital technology and pervasively discussed by scholars lately. Blended learning is a

Journal homepage: http://edulearn.intelektual.org

combination of traditional classroom learning such as the face to face and the online learning [2], [15]. Meanwhile hybrid learning is the type of blended learning that focuses more on bridging the physical and virtual classroom closer together into a more complete education [5]. E-learning allows the students to interact with their lecturer only through the internet but not able communicate with their lecturer even if they are in the same premises [16]–[18]. Distance learning is quite similar to the e-learning, but the learner take their course without moving out from their place [19]. Through online English language learning, the students are allowed to interact with their lecturer face-to-face along with language learning online through the internet or software such as the academic information sistem (Siakad), Edlink, or other platform from various provider, through learning management system (LMS) or cloud-base system etc. [2]. In online learning, the students participated in the learning spaces through synchronised and asynchronised [20]. Among the four terms, online learning is considered purely students experience during covid 19 pandemic, either syncronous or asyncronous virtual classroom, as for several months no one allowed to have a face to face class set up [3], [20].

The delivery of online language learning is usually supported by LMS or asyncronous set up [10], [21], [22]. LMS is a noteworthy tool that functions as a space to regulate the flow of information to and from students, with lecturers, as well as operators with features that allow all data storage, distribution, recording, lecturing, attending list, teaching materials, then summarized, uploaded, or downloaded as needed and per curriculum expectations [4], [22], [23]. Online language learning in some cases is syncronous set up, that students and lecturer can communicate using Zoom or Google meet platform in the same time premises. Allegedly, the implementation of online language learning has been spurred by the spread of Covid19, which then have lead to the awareness of most educators about the strength, weakness, oppportunity, advantage, and challenge on this e-learning mode [14], [24]–[27].

There are several precondition for students to benefit from technology-based learning [22], [28], [29][27]. The precondition in question is about the need for equality between what is expected and what can be achieved, by means of gradual improvements carried out in accordance with the development of supporting infrastructure, knowledge of educators and students. Some reasons why various IT acceleration projects do not run smoothly in most of the cases are due to the proposed design has not been adapted to environmental conditions and students' abilities [14]. Apart from that, there are a large number of research results that taken as a reference where technology has preceded one step more advanced than readiness for implementation [22], [29], [30].

The Covid 19 pandemic has drastically changed people's habits and perceptions in face-to-face learning, suddenly knowing and experiencing online learning especially in the developing context. Digital technology literacy is one of the positive point on the online learning implementation. Not merely the trend demand but more on the required skill for the students when they graduate. Students today is considered as digital natives who play a very important role in reforming education from conventional to technology based learning. This may be apart from a forced situation such as Covid 19 pandemic which has been widely discussed in various perspectives, but a measure of future educational progress, and the ability of students to actualize it in the world of education is the beginning of a long journey ahead. The significant growth of technology in education has replaced the traditional language learning such as using the blackboard and chalk in explaining the subject by technology-based learning of doing homework on the laptop, internet, or tablet [31]. Among the four major skills: aptitude, technical, job, and soft, the technical skills can be learnt through online learning [32]. The online language learning supplements and supports the students to gain more awareness and confidence in a specialized field, which enhances the possibilities for employment. From the previous definition, online learning used new multimedia technologies and the internet to improve the quality of learning and teaching. It would widely use, and bring revolutionary changes to education. The use of new multimedia technologies and the internet in learning as the means to improve accessibility [31].

There are various things that need to be understood before digital-based learning is truly applied to an educational community. Students should have computer literacy and digital learning competencies [33], self-directed learning and self-regulation for online learning [9], [14], [27]. In this regard, students should have 21st century skills, including information and communication technologies (ICT) literacy, critical thinking, creativity and innovation, self-directed learning skills and metacognitive awareness. [14] states that students should have the readiness for online learning, such as student preference in course modality, the students' ability to participate in self-directed learning, as well as student competence and confidence in utilizing computer-mediated communication. Similarly, [34] state that students should have learner control, self-directed learning is success, and its competitive advantage, is the high number of teachers and students who intend to continue online learning, a concept termed "continuance intention" [35], [36]. Students who regarded themselves proficient computer users also had relatively higher positive attitudes toward the online language course and therefore have better grades from the assessment [37].

3

The previous study on the variable technical abilities, Technology awareness, and self directed learning indicated reliability rank 0.9, 0.82, and 0.78 but their attitude toward online still have apprehension [7]. Some scholars revealed that traditional to online learning is such a transitioning model that involve some uneasiness among students ([7], [14], [38]. Proliferation of online learning recommendations is often met with a mixture of requirement and readiness. In the field of education, there are some literatures that can be used as input either to lecturers or students. However, the phenomenon of student readiness is an absolute thing to study, as they are both the object as well as the subject of the learning process itself. A preliminary study was conducted by the researchers, toward 11 students from two different universities in the Riau Islands. The question was very general, seeking the students opinion and feeling on the online learning and face to face that was held alterlately during covid-19 pandemic. There were ten students stated that no much issue on the face to face learning activity, as they are get used to since elementary school grade. Five of the students expressed their unreadiness to have the online learning due to the gadget and signal issue, meanwhile the other five students had concern on the LMS (such as academic information system) merged into online learning, such as Zoom, google classroom to suport online learning did not seem real learning. Only 1 student seemed very happy on the onpine learning as he assumed to have more time outside the campus for extra activities rather than attending the regular class. This shows student's readiness should be taken into consideration before the implementation of online learning. Therefore, the objectives of the present research are to determine the level of students' technical ability, technology accessibility, self directed learning on student's attitude towards English language e-learning and their continueance attention in Riau islands. There are 3 objectived of the present study: 1) To determine the level of technical abilities, technology accessibility, attitude towards online English language learning, and Continuance Intention. 2) To identify the impact of variables technical abilities, technology accessibility, and self directed learning on attitude towards online English language learning. 3) To identify the impact of attitude towards online English language learning on continuance intention.

METHODOLOGY

The purpose of the present study is to develop the students readiness for online English language learning on their continuance intention of e-learning use. The student's readiness was based on the level of students technical abilities, technology accessibility, and self difected learning. The research model was based on the previous studies upon the variables technical abilities (TAB), technology assessibility (TAC), self directed learning (SDL) ([7], readiness for e-learning (REL) [39], and the continuance intention of the e-learning (CI) [36]. To achieve this goal, the present study opted to determine the level of TAB, TAC, and SDL that predict REL and CI. There was no manipulation or intervention on the present study other than administering the instrument(s) necessary to collect the data from respondent. In this type of the present study, the phenomena that occur naturally was the one investigated.

There are 7000 students from the 2 universities as the population of the present study in Riau Islands. The representative participants were selected by referring to $N/N(d))^2+1$, (N=total population d=precision value 0.1) as the formula suggested by [40]. The sample considered was 102 students from non English department students. There was no characteristics of social economy background, gender, nor stratified characteristics taken into account. Non-random sampling technique was applied. The present study applied the quantitative research method where generalization was incumbent. The argument about a representative sample was based on the two universities in the Riau islands, Indonesia, having a homogeneous population.

To accomplish the aims of this research, the 25 items of questionnaire was developed to collect data from respondents. The developed questionnaire based on 3 variable independent (Technical ability, technology accessibility, self directed learning), 1 variable intervening (Attitude towards English language elearning), and 1 dependent variable (continuance intention) referring to the research model conducted by [7], [36]. Each of the variable consisted of 5 statements with a Likert scale choice, starting from strongly disagree to the highest strongly agree. Two statements (item no3 and 24) were negatively phrased to avoid response bias that could occur due to the use of fivepoint Likert format. This research is a survey research, quantitative approach. The questionnaire was made in 2 languages; Indonesian and English. The researchers involved two language experts to verify and confirm that the statements in Indonesian, as they are all Indonesian.

The first step was to validate the questionnaire using Rasch measurement model (RMM). This is considered as a pilot test. The Rasch Measurement model verifies not only item but also persons [41]. To ensure the validity and reliability of the questionnaire, before conducting the actual research, the researcher employed the questionnaire to the pilot test among 36 students utilizing the RMM version 3.69.1.11. The instrument that was used to obtain the required data should be validated and reliable, as it is known to be very crucial [42]. From the results of the pilot test, validity and reliability were obtained as depicted in table 1. The

Paper's should be the fewest possible that accurately describe ... (First Author)

items which were within the accepted category would be used, while the items that were discarded were not used on the present study. Through the RMM, there were 5 items (4, 16, 17, 21, & 24) dropped due to unfit category. Those items were out of MNSQ category ranged from 0.5 to 1.5 and ZSTD ranged from -0.2 to 2.0. The reliability of the questionnaire was 0.83 for person and 0.68 for item. Some scholars stated that the reliability in the range of 0.60 - 0.80 are considered moderate, but acceptable [43], [44].

Dependent	Independent	Rasch Measurement		Smart PLS	S ver 2.0	
Variable	Variable	Model (Winstep 3.69.1.11)	Validity	Reliability	Hypothesis testing (R ² and Q ²)	Model Measurement (t-statistics)

Remark		items were dropped. The reliability 0.83 (person), 0.68(Item)	exploratory research)	(weak), and <0.5 (not acceptable) (George and Mallery, 2003)		accepted.

The present study procedure begins with the issue, objective, respondents, and literature review. The questionnaire was used as tool for gathering data in this survey research. The researcher distributed the questionnaire to 102 students. The data collected were analysed with the help of the PLS ver 2.0 software. The Smart PLS data analysis was utilized to define multivariate analysis on the present research. The analysis was to measure the relationship between dependent and independent variables in the concept multiple linear regression is an attempt to predict a dependent variable from several independent variables [41], [45], [46]. Considering the data distribution and applicability on relatively small sample size, PLS was employed. In addition to the merits related to the validity and realiability questioned pilotted through the help of the RMM.

It needs to be mentioned here that student's readiness on the online English language learning adopted from [7] study about blended learning. Meanwhile the continuance intention refer to the [36] study which explored the factors influencing student's continuance intention to use the LMS. To assess students readiness on the online English language learning based on the technical abilities, technology assessibility and self directed learning, items were then developed. Table 3 illustrates the full questionnaire. PLS was chosen for four reasons; 1) the broad scope and flexibility concerning theory and practice; 2) can be employed in small sample sizes; 3) complex models; and 4) two level of assessments: (a) the measurement model (i.e. reliability, convergent and discriminant validities); and (b) the structural model assessment (i.e. path coefficients and R^2) [36], [41], [47]. The sequence of PLS analysis stated briefly in table 2 [41], [48]. There are two types of model test includes, namely the outer model (test indicators) and inner model (test hypotheses). Each items measured with standard criteria [41], [47], [48]

MODEL TEST	OUTPUT	CRITERIA
Outer Model (Indicator Test)	 a. Convergent validity b. Discriminant validity c. Average variance extracted (AVE) d. Composite reliability 	a. Factor Loading >0.7 b. Cross loading with latent variables >the corr. value of other latent variable c. AVE, criteria > 0.50 d. Acceptable if ≥ 0.70
Inner Model (Hypothe sis Test)	a. R ² of endogen laten variabel b. Q ² of endogen latent variable c. F ² (effect size measurement) d. Coeffisien parameter and t-statistics	 a. R² in 0.67; 0.30; 0.19 indicates that the model is good, moderate, or weak. b. Q²>0 indicates the model has predictive relevance. The effect size Q²: 0.02, 0.15, 0.35 as small, medium, and large effect. c. (>=0.02 is small; >= 0.15 is medium; >= 0.35 is large). d. Estimation value of path analysis in the structural model must be significant. This is done through the bothstraping procedure. t-statistics >t-table (significant level 0.5, two tailed test, t-table=1.96 (Significant)

FINDING AND DISCUSSION

The questionnaire for the study, prepared in hard copy, manually distributed to respondent. This is to ensure that the questionnaire filled in accordingly. There was only 10 percent of the respondents respond

The mean score of the variables TAB, TAC, SDL, AEL, and CI were 3.74, 3.82, 3.95, 4.00, and 3.82. These value were lower than the previous study conducted by [7] 3.87, 3.89, 3.73, 3.23. The term of the attitude to blended learning on the previous study is not as the present study term. The preliminary study indicated that the face to face class set up was not much issue to students either utilize internet or other type audio. This is due to the students felt accompanied by lecturer and collegues. The concern from students mostly on the online learning, when they are not in the same class premises.

The earlier phase of PLS measurement are validity and reliability analysis. The hypothesized lingkage among the variables were measured using the boothstraping procedure. To begin with, all of the factor loadings were examined above the cut off limit of >0.7 [41], [47]. The AVE score was higher than 0.5 for all contructs, composite reliability more than 0.7, and R^2 values above 0.8. These values satisfied the the threshold acceptance level and supported to internal consistency and convergent validity of the model.

Paper's should be the fewest possible that accurately describe ... (First Author)

The t-statistics of variables TAB on TAC, and SDL on AEL indicated value less than t-table 1.96 (significant level 0.5, two tailed test). Therefore, the H0 hypothesis (no impact of TAB on AEL, nor TAC on AEL) was accepted. Meanwhile the SDL on AEL and AEL on CI showed t-statistics was more than t-table, means Ha was accepted (theres is an impact of SDL on AEL and AEL on CI). The mediation effect of Attitude towards online English Language learning in affecting the Continuance Intention suggested positive impact. The detail of the findings as stated in table 4.

The Q² predicted the study model, that the variables TAB, TAC and SDL predict 14% on the level of AEL (medium effect). Meanwhile the AEL as the mediator can predict 39% toward CI (large effect). The performance of the 3 exogen variables indicated the SDL as intervening variable mostly contributed toward CI, and among the three, SDL is the highest. This findings answer the second and third objectives of the present study. The objective to identify the impact of variables technical abilities, technology accessibility, and self directed learning on attitude towards online English language learning has been answered. Among the four exogen variables, the F² value 0.52 of SDL \Rightarrow AEL and 0.78 of AEL \Rightarrow CI are the highest compare the TAB \Rightarrow AEL and TAC \Rightarrow AEL. Technical abilities and technological accessibility of the present study prove to be a minor hindrance which result a recurrent phenomena of the previous study result [7]. The phenomena of technical abilities and technology accessibility as the minor factor on the students attitude corroborate [7] study.

The present study establishes the theoretical usefulness by pointing towards the relevance of addressing the specific factors Self directive learning through attitude towards online English language learning that exert an influence on continuance intention on the use of online learning. The pigure 1 presented the PLS algorithm which evaluated the reflective structural model.

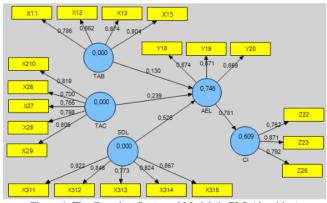

Figure 1. The Complete Structural Model (in PLS Algorithm)

CONCLUSION

This study focused on tertiary level students readiness for continuance intention to use online learning in Indonesia. Online learning requires an accessible internet connection, gadgets, and such types of devices which not every students has access to these luxurious goods. However, the present study results show that technology mastery and access are less of a concern than self direct learning. Although in the preliminary study, respondents mostly concerned on the hindrance of online learning, but the study results does not indicate the phenomena of the study result. Respondent discreacy of having no sufficient gadget in

7

such online learning laptop as the main, but in fact in an emergency condition, cell phones can still function as an intermediary tool. Present study indicated that self-directed learning is a crucial factor in building positive attitudes of students in utilizing digital technology in learning. The obstacles is often experienced by students during the online learning as the LMS platform such as Siakad and Edlink (the platform which are commonly utilized in campuss) come to appear not so clear on the small gadget screen. But the experience of digital classroom space is the digital literacy skill required. Students need to be accustomed on the digital activities. Students verbally responded that the experience was complained unsufficient by some alumni. Even in some cases there are students who don't know how to send emails. As many researchers have complained about, the context of developing countries is the lack of supporting infrastructure for online learning. But from this study it seems that it has diminished, though not completely gone. But what needs to be watched out for is the positive attitude of students is influenced by their motivation. There is a saying where there is a will there is a way.

The previous study compared the attitudes toward the traditional classroom setting vs blended classroom setting, meanwhile the present study stick to the belief based on the preliminary study that there was no much issue on the face to face classroom set up. In fact, the results of the prilimany study are strenuous as the findings of previous studies [7] that face to face classroom set up makes students more comfortable than online learning.

The strength of syncronous and asynronous online learning, as stated by [26]are in terms of authentic, flexibility, live interaction, development of critical thinking and student-centered learning process. Further [26] emphasized the weakness of syncronous online learning are accessibility, development of critical thinking, mastery of topics, enjoyable class, connection issues, and network issues meanwhile the asyncronous online learning are due to the lack of interaction, low mastery of content, dull class, connection issues, as well as network issues. Some points from the present study are in line with what was stated by [26] yet in terms of technology assessibility and technical ability did not significantly affect students' attitudes toward online English language learning, but self-directed learning. The self directed learning manifest to the attitude toward online English language learning usage. The online english language learning has provided a clear roadmap and opportunity for educators and students to take a more advantages and engage major stakeholders to create novel market in the case the pandemic longer last, or become a general acceptable mode of teaching and learning[27], as declared by MOEC on the hybrid learning discourse.

The foreign language proficiency must be supported by the ability to interact with digital technology and there needs to be a positive attitude to deal with these changes. The future study can explore more samples to perform the similar model. Researcher can consider expanding the research sample by involving students from various majors. Because online learning, hybrid learning or whatever the term may appear in the future, it is still learning that will continue to innovate and involve digital technology that is changing rapidly. Researchers who will explore this field need to see whether language learning and social science have differences in student readiness. Further researchers can compare the level of behavioral readiness and expertise of students, lecturers and providers in contributing to smooth learning.
